老师问答预测（中英对照）

> 依据：评分标准（Team 65%：Content 40%、Teamwork 10%、Q&A 15%），课堂记录（`课堂记录/`，位置见《统稿核对与细节数据库》第六节 K），课件 Week 1 至 8，以及当前 PPT（35 页）。所有数字以 PPT 为准。 用法：每题先看”问”，自己先答，再对照”答”。英文是上台说的版本，控制在 30 秒以内；中文是要点。“概率”是我们的判断，“依据”写明为什么觉得老师会问。 口径：**一切答案以 PPT 为准**（含各页备注和附录）。标〔PPT 外〕的内容只在老师追问时补充，先说 PPT 上的数字。

一、评分标准告诉我们什么

Content（40%） A 档要求：analyse many new and abstract data; ideas organised systematically and logically; all recommendations useful.

- 老师会怎么考：挑数据的来源和日期；挑页与页之间的矛盾；问建议能不能执行（谁来做、什么时候、触发条件是什么）。
- 我们怎么应对：每个数字能说出 SIN 序列号或成交；前后口径一致；每条建议都有触发线。

Teamwork（10%） A 档要求：excellent coordination and transitions; well paced; finish on time.

- 老师会怎么考：不一定靠提问考，但会点没讲这部分的人回答别人的页，看全组是不是同一套数字。
- 我们怎么应对：全员背第九节的数字卡和第八节的”30 秒总答”。

Q&A（15%） A 档要求：understand and answer all questions; confidence and full knowledge of work presented.

- 老师会怎么考：连续追问，问到你答不上为止（“I can ask hard questions”，Week 1 记录开头）。
- 我们怎么应对：先给数字，再给一个理由，最后指出哪一页；不知道就说出我们的口径和怎么查。

另外两条和分数直接相关：个人分来自 contribution list（Week 7 记录约 99%）；超时扣分，老师可能直接叫停（Week 4 记录约 96%）。

答题模板 Answer template

> “[Number]. Because [one reason]. It’s on slide [X].” 例：Seventeen point nine percent. Because three ships are fixed and the two spot ships use 2025 averages. It’s on slide 19.

二、老师的提问方式（课堂样本）

课堂上他的套路很固定：先要一个数字（“Make a guess”），再问 “Why?”，用 “isn’t it?” 逼你确认，然后追问后果，最后角色扮演（“Let’s say I’m your boss. How are you going to tell me why?”）。所以：

1. 数字要脱口而出，不要说 “around” 之后停住。
2. 被 “isn’t it?” 逼问时，同意事实，但说出我们的处理办法，不要被带着改口。
3. 他说 “I’m your boss” 时，用董事会汇报的口吻回答：结论、风险、我们怎么做。

三、最可能被问的十二题（索引）

序	题号	一句话
1	Q43	现在处于市场周期哪个阶段，你们对应怎么做（第五节）
2	Q20	战争什么时候结束，霍尔木兹重开会怎样
3	Q1	为什么油轮 70%、散货 28%，不全押最赚钱的油轮
4	Q2	为什么只留 500 万现金
5	Q3	二手船这么贵为什么还买，为什么不租入、不新造
6	Q21	运价会涨还是跌，分船型说
7	Q30	17.9% 真的是底线吗
8	Q12	40,000 三年期租是别人的船，你们拿得到吗
9	Q17	新船交付多少，2027 年交付潮怎么办
10	Q42	10 月一年期 MR 已经 43,000，为什么不马上把 MR #2 锁掉
11	Q26	30/50/20 的权重是不是拍脑袋
12	Q45	什么会把油轮市场推进崩塌期，你们盯哪些信号

四、按部分的问题

第 1 部分 决策（第 3 至 6 页）

Q1 为什么油轮 70%、散货 28%？油轮现在最赚钱，为什么不全投油轮？（概率：高｜依据：作业布置原话 “which market is going to give you most return on investment now”，Week 4 约 95%）

Q: Tankers earn the most right now. Why not put everything into tankers?

A (EN): Because the top earner today is also the most expensive and the most reversible. A five-year-old Suezmax costs 1.44 times newbuild, and its three-year rate is less than half its one-year rate. So our tanker money goes where prices are at or near replacement cost: MR at 0.99 times newbuild, and crude Aframax with the lowest orderbook of our five segments, 8.4 percent. Dry bulk gets 28 percent as a second cycle with no war premium.

要点： 油轮里只买不贵的部分；Suezmax 两个见顶信号（第 14 页）；散货是第二个周期，分散风险。

Q2 为什么只留 500 万现金？不够用怎么办？（概率：高｜依据：“Last year, one group left with about $100 million… do not have too much spare cash”，Week 7 约 97.9%）

Q: Why only five million in cash? What if you need more?

A (EN): Idle cash earns nothing in a strong market, so we put 98 percent to work. Five million covers about 137 days of fleet operating costs, and the three fixed charters pay in about 2.7 million a month, so cash builds up during the year. We have no debt, so no repayment can force us to sell. If we need more, the Aframax on its three-year charter is the easiest ship to mortgage.

要点： 500 万除以每天 36,560 约 137 天；锁定租金每月约 268 万；全股权没有还款压力；第 23 页把”现金薄”列为我们自己承认的弱点。

追问： 10 月 MR 评估涨到 5,200 万，2.5 亿不够了吧？ **A (EN):** The same plan would cost 254 million at October prices. We bid in the 50 to 52 million range; any excess comes from the cash line, which would fall to about one million, and fixed hire refills it within weeks.

Q3 二手船价这么高，为什么还买二手？为什么不租入、不新造？（概率：高｜依据：“Ordering new ships is bad… second hand ship prices are crazy… Charter is worse”，Week 5 约 13%）

Q: You said yourself prices are high. Why buy secondhand, and not charter in or order newbuilds?

A (EN): We costed all three routes for both segments. Chartering in only earns the spread: a Kamsarmax costs 22,000 a day and earns 23,000, so plus 350,000 a year, or minus 3.2 million at 2025 rates. An MR costs 30,000 and earns 27,000, so it loses 1.05 million. A newbuilding takes one and a half to three years, so it earns nothing in our twelve months. And secondhand prices in our segments are at or near replacement cost; only Suezmax is far above.

要点： 第 5 页；高价是 Suezmax 的问题，我们的船型 0.96 至 1.13 倍。

Q4 为什么买 5 年船，不买更便宜的 10 年船？收益率不是更高吗？（概率：中｜依据：课件 Week 3 第 53 页船价与船龄、Week 7 第 9 至 10 页新旧船取舍）

Q: A ten-year-old ship is cheaper and earns almost the same rate. Wouldn’t your return be higher?

A (EN): In year one, maybe slightly. But a ten-year-old MR costs more per remaining year of life, 2.67 million against 2.50 for a five-year-old. It also has higher operating costs and a heavier survey coming, oil-major charterers screen older ships harder, and carbon rules hit older ships first. We want ships that keep their value and stay easy to charter.

要点： 每剩余年成本 250 万对 267 万（第 5 页）；Eco 船受碳规则影响小。

Q5 几内亚铝土矿大部分是 Capesize 运的，为什么买 Kamsarmax？（概率：中｜依据：第 6、10 页讲铝土矿，课上反复讲船型选择）

Q: Most Guinea bauxite moves in Capesizes. Why Kamsarmax?

A (EN): True, Capesizes carry about 90 percent of it, Clarksons article 213368. That demand tightens the whole bulk fleet. Kamsarmax is the largest ship that loads directly at Port Kamsar, and it can switch between bauxite, coal, grain and minor bulks, with far more ports and charterers. It’s also a smaller ticket, so we hold two ships instead of one. We did not screen Capesize prices in SIN, so we won’t quote a number for it.

要点： 承认事实，讲灵活性和分散；不编 Capesize 数字。

Q6 课上说 Supramax 租金和 Panamax 差不多，为什么不选 Ultramax？（概率：中｜依据：“Handymax is $32 million. Panamax is $33 million. Which one will you get?”，Week 3）

Q: Why Kamsarmax rather than Ultramax?

A (EN): Per tonne, Kamsarmax is cheaper: a five-year-old Kamsarmax costs about 512 dollars per deadweight tonne, an Ultramax about 614. The September one-year rates were 20,250 for Kamsarmax and 19,500 for Ultramax. And bauxite and coal move in 80,000-tonne parcels, like the DBCT coal fixture.

要点： 〔PPT 外〕以上数字来自 SIN 9 月评估，PPT 上没有，只在追问时用：4,200 万除以 8.2 万吨，3,900 万除以 6.35 万吨；一年期 20,250 对 19,500。PPT 上能说的是第 6 页”Kamsarmax is the largest ship Port Kamsar can take”和第 9 页 80,000 吨煤炭成交。

Q7 MR #1 是期租出去的，航线由租家定，你们说的”贸易”还算数吗？能不能规定它只跑这条线？（概率：中｜依据：组员已发现的问题；第 6 页 MR 卡片）

Q: MR #1 is on time charter, so the charterer decides where it goes. What does “your trade” mean for that ship? Can you restrict it?

A (EN): For MR #1, the trade is the charterer’s choice, and our income is the daily hire whatever the route. The route matters for MR #2 on spot. We could narrow the trading limits in the charter party, but a charterer pays less for less flexibility, and our 30,000 benchmark has normal limits. We use trading limits for risk: excluding war zones and sanctioned trades unless the charterer covers the extra cost.

要点： 期租收入与航线无关；航区条款用于排除战区与制裁，而不是锁死航线。

Q8 为什么全买日本韩国造？Section 301 对你们意味着什么？（概率：中｜依据：港口费暂停 11 月 10 日前后到期，就在展示期间）

Q: Why only Japan or Korea built ships? What does Section 301 mean for you?

A (EN): The US port fees under Section 301 target Chinese-built ships and Chinese owners or operators. With a non-Chinese owner, our five ships pay none. The suspension ends around 10 November, inside our presentation window. The market already shows a gap: a Japan-built Kamsarmax sold 2.75 million above its China-built sister, and that gap includes this port-fee risk.

要点： 船东不是中国公司这个条件要说出来；价差”包含”港口费风险（还含脱硫塔），不说”就是”。

Q9 MR 订单簿 18%，MR 不是供过于求吗？（概率：中｜依据：第 23 页我们自己写了这个弱点，老师一定会顺着问）

Q: The MR orderbook is 18 percent. Isn’t MR oversupplied?

A (EN): It’s the weakness we state ourselves on slide 23. Three offsets: we buy at replacement cost, so a price correction hurts us least; products trade grows 6.3 percent in 2027; and one MR is fixed for a year. Also, the MR orderbook is smaller than the fleet over 20 years old, a cover of 0.65 times, so much of it is replacement once scrapping returns.

要点： 18% 是按载重吨，按艘数是 15.6%（附录 A1 两种口径）；替换测试 0.65 倍（第 13 页）。

第 2 部分 定价（第 7 至 9 页）

Q10 每个价格都是真实成交吗？MR 的价格呢？（概率：高｜依据：作业要求 “last transacted sale or last fixture”，Week 4 约 95%）

Q: Is every price a real transaction? What about the MR price?

A (EN): Three ships are priced from real sales. For the MRs, the latest sales in the register had no five-year-old ship with a published price: two were newbuild resales at undisclosed prices, the others were 2014 and 2007 built. So we use the Clarksons five-year-old assessment, 50 million in September. In total, sixteen real transactions and one assessment.

要点： 第 7 页；附录 A3 可以翻给老师看那 4 笔 MR 成交。

Q11 两笔 Aframax 成交是 4、5 月的，是不是太旧了？（概率：中｜依据：数据新鲜度是 Content 的一部分）

Q: Your Aframax sales are from April and May. Aren’t they stale?

A (EN): They’re the last done for a 2018 Japanese Aframax, which is what the brief asks for. As a check, the September Clarksons assessments are 85 million for a five-year-old and 72.5 million for a ten-year-old, so an eight-year-old near 75 million fits. And the three-year charter makes the asset easy to finance or sell.

要点： 用两个评估值夹住 8 年船。

Q12 40,000 三年期租是别人 2011 年的船，你们拿得到吗？10 月三年期评估只有 37,500。（概率：高｜依据：第 8 页写明 benchmark，老师会追问能不能实现）

Q: The 40,000 three-year rate belongs to someone else’s 2011 ship. Can you get it? And the October three-year assessment is only 37,500.

A (EN): It’s a benchmark, and our ship is seven years younger, so a charterer should pay at least as much. If we only get 37,500, we lose 0.88 million a year, 0.35 points. Across the three fixed ships, October assessments are about 2.9 million above our base in total, because the MR one-year rate rose to 43,000 against our 30,000.

要点： 第 8 页卡片 2；三条锁定腿按 10 月价：MR +455 万、Aframax −88 万、Kamsarmax −79 万，合计 +290 万左右。

Q13 CNR 是谁？租家违约怎么办？（概率：中｜依据：第 8 页表格）

Q: Who is CNR? What about counterparty risk?

A (EN): CNR means the charterer was not reported in the SIN register; it’s not a company. Our rates are benchmarks; we would fix our own ships only with first-class names like the ones in the table: Suncor, ExxonMobil, AET, Cargill. If a charterer defaults, the ship goes back to the spot market, and the bear case shows what that earns.

要点： CNR = charterer not reported。

Q14 25.60 美元/吨怎么换算成每天 27,400？（概率：中｜依据：“Worldscale”、TCE 是 Week 3 课件内容，第 9、20 页和附录 A5）

Q: How do you get 27,400 a day from 25.60 dollars a tonne?

A (EN): Gross freight is 80,000 tonnes times 25.60, about 2.05 million. The round voyage is 39 days: 30 at sea, 9 in port. Bunkers are 848 tonnes at the September Singapore price of 874.94, about 0.74 million. Port costs are 160,000 and commission 3.75 percent, about 77,000. That leaves about 1.07 million, divided by 39 days: about 27,400 a day, 19 percent above our 23,000 base.

要点： 附录 A5。注意 A5 第 4 行写法有歧义（“160,000 + 3.75% × 2,048,000 = 76,800”），口头要说清楚 76,800 只是佣金。

Q15 数据是 9 月 12 日的，现在都 10 月底了，更新了吗？课上说要看 Lloyd’s List，你们用了吗？（概率：低至中｜依据：“Please refer to Lloyd’s List”，Week 4 约 98%）

Q: Your data is from 12 September. Is it up to date? Did you use Lloyd’s List?

A (EN): Prices were extracted on 12 September and re-checked on 15 October; slide 16 shows every change, and each one strengthens our call. We used Clarksons SIN as the main source, as the brief suggests, with 55 news items, plus one industry news item marked as non-SIN on appendix A6.

要点： 第 16 页；若终版刷新已完成，说出刷新日期。

第 3 部分 供需（第 10 至 13 页）

Q16 原油运量 2026 年下降 7.3%，你们还买原油轮？（概率：高｜依据：“whether the tonne-miles has increased or not. Why has it increased?”，Week 5 约 50%）

Q: Crude volumes fell 7.3 percent this year. Why buy a crude tanker?

A (EN): Because ships are hired by tonne-miles, not tonnes. Volumes fell, but the average haul rose 3.3 percent as cargoes reroute around Hormuz and the Red Sea, and sanctions take about 20 percent of crude tanker capacity out of normal trade. That’s exactly why we don’t trust it for long: our Aframax is fixed for three years.

要点： 平均运距 = 吨海里 ÷ 吨数（Week 5 第 53 页）；第 10 页、附录 A10。

Q17 未来有多少新船？2027 年交付潮怎么办？（概率：高｜依据：“How many ships are coming into the market, what’s the scrapping going to be?”，Week 5 约 60%）

Q: How many ships are coming, and how will you handle the 2027 wave?

A (EN): Kamsarmax deliveries peak at 171 ships in 2027 and 141 in 2028. MR runs at about 106 a year. Crude Aframax is tiny: 18 and 15. Our answer: the Aframax is fixed for three years across the whole wave, the one-year charters on MR and Kamsarmax let us decide again in mid-2027, and in all three segments the orderbook is smaller than the fleet over 20 years old.

要点： 第 12、13、22 页；替换测试 Kamsarmax 0.76 倍、MR 0.65 倍、原油 Aframax 0.28 倍。

Q18 为什么现在几乎没人拆船？以后会恢复吗？（概率：中｜依据：Week 6 第 43 至 49 页拆船决定因素）

Q: Why is almost nobody scrapping ships, and will it come back?

A (EN): Scrapping is a business decision: with earnings this high, owners keep old ships trading. Clarksons noted on 9 October that recycling has been below 0.5 percent of the fleet a year for five years, so an overhang of old ships is building. When rates normalise, those ships go, and that’s what absorbs the new deliveries.

要点： 2026 年至今 Kamsarmax 交付 153 艘只拆 6 艘（第 11 页）；新闻 #229922。

Q19 成品油贸易 2026 年跌了 8.9%，2027 年 +6.3% 只是反弹吧？（概率：中｜依据：第 6、10 页的 +6.3% 很显眼）

Q: Products trade fell 8.9 percent in 2026. Isn’t 6.3 percent just a rebound?

A (EN): Yes, partly. In 2027 the volume is still about 3 percent below 2025. Our MR case rests mainly on price and distance: the average haul rose 19 percent from 2019 to 2024 as refining moved east, and we buy at replacement cost, so we’re not paying for a boom.

要点： 2027 年 10.29 亿吨仍低于 2025 年 10.62 亿吨；承认后讲运距和买价。

第 4 部分 市场与新闻（第 14 至 16 页）

Q20 你们认为战争什么时候结束？霍尔木兹重开会怎样？（概率：高｜依据：作业布置原话 “when do you think the war is going to end?”，Week 4 约 96%；“When Straits of Hormuz is closed… open… what’s going to happen?”，Week 5 约 74%）

Q: When do you think the war will end? What happens if Hormuz reopens?

A (EN): We don’t bet on a date, and the market doesn’t either: the Suezmax one-year rate is 140,000 against 64,000 for three years, so the market expects the premium to fade within a year or two. If Hormuz reopens, we lose only the MR spot upside: the Aframax is fixed, and our bear case already uses 2025 averages, 17.9 percent. If it stays closed, we move toward the bull case, 23.7 percent.

要点： 用期租曲线回答”何时结束”；两种结果的收益都说出来。

Q21 运价会涨还是跌？分船型说。（概率：高｜依据：“tell me whether the freight rates will go up or go down… justify with news articles”，Week 3 约 88.3%）

Q: Will freight rates go up or down? Segment by segment.

A (EN): MR: firm now, softer when the 2027 ships arrive. Aframax: a war premium that ends with a ceasefire or sanctions relief, so we fixed it for three years. Kamsarmax: firm in the fourth quarter on grain, under pressure in 2027 with 171 deliveries. Each call has a news source on slide 16 and appendix A6.

要点： 第 16 页下半部分三条判断。

Q22 Suezmax 现货一天七十多万，“贪心”一点跑一年不行吗？（概率：中｜依据：“Who will lock in at $1 million? Nobody… Greedy people.”，Week 5 约 11%）

Q: Suezmax spot is over 700,000 a day. Why not be greedy and run one for a year?

A (EN): 718,000 is one week in a war. The one-year rate is 140,000 and the three-year 64,000. We would pay 130 million, 1.44 times newbuild. A ceasefire would cut both the earnings and the ship’s value. In class, secondhand above newbuild is a peak signal, and the VLCC case that turned down a long charter ended with a loss.

要点： 第 14 页两个见顶信号；Week 3 课件第 92 页、VLCC 案例。

Q23 第 16 页写 “Fixed leg has upside”，但 10 月 Kamsarmax 和 Aframax 的期租都比你们低？（概率：中｜依据：第 8 页和第 16 页并排看会发现）

Q: Slide 16 says the fixed leg has upside, but October Kamsarmax and Aframax rates are below yours.

A (EN): Right. The upside is in MR: 43,000 against our 30,000, plus 4.55 million. Aframax three-year is 37,500 against 40,000, minus 0.88 million; Kamsarmax one-year 19,750 against 22,000, minus 0.79 million. Net, the three fixed ships are about 2.9 million better at October levels.

要点： 第 8 页备注已写好这个回答。

Q24 BDI 从 9 月跌了 20%，散货是不是在掉头？为什么现在买？（概率：中｜依据：第 15 页）

Q: The BDI fell 20 percent since September. Is dry bulk turning? Why buy now?

A (EN): It’s off the high but still strong: 2,801 on 13 October, well above our 2,000 trigger. We’re not paying a peak price: a five-year-old Kamsarmax is only 9 percent above newbuild, against 44 percent for Suezmax. One ship is fixed at 22,000, and the spot ship fixes if the BDI stays below 2,000 for eight weeks.

要点： 第 15 页。〔PPT 外〕追问时可补：BDI 2024、2025 年均值分别为 1,755 和 1,681（SIN 17259），现在仍明显高于正常年份。

第 5 部分 收益（第 17 至 20 页）

Q25 为什么按 350 天算？现货船有空载和等货时间。（概率：高｜依据：第 17 页公式，老师会挑假设）

Q: Why 350 days? Spot ships wait between cargoes and sail empty.

A (EN): 350 is 365 less 15 days off-hire for surveys and repairs. For the spot ships, the SIN earnings series and our voyage TCE already include the ballast leg. If each spot ship also waited an extra week, we’d lose about 350,000 dollars, 0.14 points.

要点： 7 天 ×（27,000 + 23,000）= 35 万。

Q26 30/50/20 的权重怎么来的？是不是拍脑袋？（概率：高｜依据：第 19 页写着 “Weights are the group’s judgement”）

Q: Where do the 30/50/20 weights come from? Aren’t they arbitrary?

A (EN): They’re our judgement, and we say so on the slide. Base gets the most because it’s the last-done fixture. Bear gets more than bull because a ceasefire and the 2027 delivery wave both have visible timetables. And the result barely moves: with equal weights, the expected return is 20.5 percent instead of 20.0.

要点： 等权（17.9 + 19.9 + 23.7）÷ 3 = 20.5%，结论稳健。

Q27 牛市用一周的现货（53,741）代表一整年，合理吗？（概率：高｜依据：第 19 页）

Q: Your bull case uses one week of spot earnings for a whole year. Is that fair?

A (EN): The bull case asks one question: what if October conditions last? It gets only 20 percent weight. And it moves only the two spot ships; the three fixed ships earn the same 32.2 million in every scenario.

要点： 第 18、19 页；锁定的三艘占基准收入 65%。

Q28 为什么只算扣营运成本前？扣了以后是多少？（概率：中｜依据：“Forecast your expected earnings before OPEX. I don’t need your operating expenses.”，Week 4 约 96%）

Q: Why only before OPEX? What’s the return after OPEX?

A (EN): The brief asks for earnings before OPEX. After OPEX of 36,560 a day, the base case is 14.8 percent. If we charge operating costs for all 365 days, it’s about 14.5 percent, and the bear case about 12.5.

要点： 第 19 页和附录 A7 按 350 天扣 OPEX（1,280 万）；全年 365 天约 1,334 万，被问到时主动说出这个更严的数。

Q29 佣金呢？（概率：中｜依据：第 17 页写了 0% 佣金）

Q: What about commission?

A (EN): We set it to zero so the slides match gross hire. At the industry norm of 3.75 percent, the base case is 47.8 million, 19.1 percent, and every scenario falls by the same share.

要点： 第 17 页。

Q30 17.9% 真的是底线吗？2025 年并不是很差的年份。（概率：高｜依据：投资者与贷款人的问题 “can this company survive in a downturn market?”，Week 7 约 44.4%）

Q: Is 17.9 percent really a floor? 2025 wasn’t a bad year.

A (EN): 17.9 is the lowest of our three scenarios. We also ran a harsher stress test: the worst twelve months for spot earnings since 2010, November 2011 to October 2012. With three ships fixed, the fleet still made 15.2 percent before operating costs and about 10 percent after. With only two fixed, it would drop to 13. That’s why we fix three. On slide 20, returns fall below 15 percent only if the two spot ships together earn under 15,100 a day.

要点： 压力测试 15.2% / 10.1%；两艘锁定 13.0% / 7.9%；第 3 页合计行、第 20 页。

Q31 一年后船值多少？折旧算了吗？（概率：中｜依据：“For every ship that you buy, we need to look ahead… or am I just going to sell the ship after a few years?”，Week 5 约 61%）

Q: What’s the fleet worth after a year? Did you count depreciation?

A (EN): The brief asks for earnings, so the return excludes asset value. Using the course rule of thumb, 5 to 6 percent a year, depreciation is about 12 to 15 million on 245 million of ships. Because we buy at or near replacement cost, a price correction hurts us far less than a Suezmax bought at 1.44 times newbuild.

要点： 课件 Week 3 第 53 页折旧 5% 至 6%；持有期：一年期租到期前一个季度决定续租、转现货或出售。

Q32 现在买船，交船要一到三个月，第一年收入是不是少了？（概率：中｜依据：第 17 页 “Each month of delivery delay removes one twelfth”）

Q: If you buy now, delivery takes one to three months. Don’t you lose part of the year?

A (EN): Yes, each month of delay removes one twelfth of that ship’s year. If all five ships arrive a month late, we lose about 4.1 million, about 1.7 points, and the base case is still above 18 percent.

要点： 4,970 万 ÷ 12 ≈ 414 万。

第 6 部分 冲击与应对（第 21 至 23 页）

Q33 触发线为什么是 8 周、20,000 和 BDI 2,000？（概率：中｜依据：第 22、23 页）

Q: Why eight weeks, 20,000 and BDI 2,000?

A (EN): Eight weeks filters out short swings. For MR, 20,000 is below the 2025 average of 22,950, the level our bear case already uses, so the trigger stops losses from going much below the bear case. For the Kamsarmax, 2,000 is about 30 percent below today’s BDI of 2,801, so we fix before rates fall back to normal.

要点： MR 2025 年均值 22,950 在第 19 页；BDI 2,801 在第 15 页。〔PPT 外〕追问时可补：BDI 2,000 仍高于 2024、2025 年均值 1,755 和 1,681。

Q34 如果全球衰退，三条贸易同时降温呢？（概率：中｜依据：第 21 页第 4 行）

Q: What if a global recession hits all three trades at once?

A (EN): Then the three fixed ships still earn 32.2 million, and the two spot ships fix for a year within weeks under their triggers. Our worst grid cell, both spot ships at 15,000 and 13,000, still gives 16.8 percent. And with no debt, nobody can force us to sell at the bottom.

要点： 第 20、21 页。

Q35 一年期租 2027 年 9 月前后到期，正好在交付潮中间，到时候怎么办？为什么不租两年？（概率：中｜依据：第 12 页和第 22 页并排看）

Q: Your one-year charters expire in the middle of the 2027 wave. Then what? Why not fix for two years?

A (EN): Our window is twelve months, and a one-year charter covers all of it. We decide one quarter ahead, in mid-2027, with the 2027 deliveries already visible: renew, go spot, or sell. And slide 13 shows the orderbook is smaller than the fleet over 20 years old, so the wave can be absorbed once scrapping resumes.

要点： 第 22 页原文写 “before the wave peaks”，组员建议改为 “mid-wave”；若未改，口头按 mid-wave 回答。

Q36 碳规则收紧谁付钱？你们的 Kamsarmax #2 已经 11 年了。（概率：中｜依据：Week 7 EU ETS 与 FuelEU，Week 8 成本归宿）

Q: Who pays when carbon rules tighten? And your Kamsarmax #2 is already eleven years old.

A (EN): On time charter, the charterer pays fuel and emission allowances. On spot, we pay them, but in a strong market we pass most of the cost into the freight rate, because shipping demand is short-run inelastic. All five ships are Eco, and four of five are under ten years old. Kamsarmax #2 is Japan-built with a scrubber, and on spot we keep its fuel saving.

要点： 成本归宿看弹性（Week 8 第 61 至 63 页）；第 21 页 “under 10 years old” 若未改，口头要说 “four of five”。

Q37 黑海打得更厉害，粮食没货了怎么办？（概率：中｜依据：第 21 页）

Q: What if the Black Sea war cuts grain cargoes?

A (EN): Kamsarmax #2 loses one cargo source, not its market. It moves to Guinea bauxite and Australian coal, where two September coal fixtures show the cargo is there. And US Gulf grain starts its season in September regardless of the Black Sea.

要点： 第 6、21 页；煤炭两笔：DBCT 到 Vizag 25.60、Newcastle 到 Hadong 23.21。

Q38 港口费暂停到期后，中国如果反制呢？（概率：低至中｜依据：新闻 #216732、#217187）

Q: If the suspension ends, what about China’s counter-fees?

A (EN): China’s fees target US-linked ships: US-owned, US-operated, US-flagged or US-built. Our ships are Japan or Korea built and would have a non-US, non-Chinese owner, so neither side’s fees apply. We’d still re-check charterers’ US calling plans in November.

要点： 第 23 页的触发表最后一行。〔PPT 外〕中方反制费用的适用范围（美国拥有、经营、挂旗或建造的船）属公开资料，答前再核实一次。

融资与新加坡（课上反复出现的角度）

Q39 如果要用贷款，银行能借多少？你们会用什么融资？（概率：中｜依据：“The value of the ship is $60 million. How much do you think the bank will lend to you?”，Week 7）

Q: If you used debt, how much would a bank lend, and what would you use?

A (EN): Typically 60 to 80 percent of the ship’ s value as a mortgage. We’ d start with the Aframax, because its three-year charter gives the bank predictable income, or do a sale and leaseback on it. We chose all equity for now, so there’ s no fixed repayment schedule in a weak year.

要点： Week 7 第 6 页、58 至 61 页、87 至 89 页、93 页。

Q40 船挂哪国旗、在哪管理？（概率：低至中｜依据：老师偏爱新加坡角度，见《统稿核对与细节数据库》H 节）

Q: Where would you register and manage the ships?

A (EN): Singapore. It’ s a quality flag, and qualifying shipping income of Singapore-registered ships can be tax-exempt under the Maritime Sector Incentive. Singapore is also where several of our benchmark charters deliver, and Singapore bunker prices set our fuel cost.

要点： 〔PPT 外〕新加坡船旗与 MSI 免税属公开资料，答前再核实一次；TP Spirit、Monte Urbasa 等在新加坡交船（附录 A4）。

课程概念（老师可能突然考概念）

Q41 概念快问快答（概率：中｜依据：Dr Yuen “assume that everything is tested”，Week 8 约 99.5%）

问	30 秒答（EN）	用在哪页
What is last done?	The most recent actual transaction; charter negotiations start from it.	7 至 9
What is TCE?	Voyage income minus voyage costs, per day, so it compares with a time-charter rate.	9、20、A5
What is Worldscale?	A tanker freight index; WS100 is the published flat rate for the route, and quotes are a percentage of it.	9、A5
Who pays what on a time charter?	The owner pays capital and operating costs; the charterer pays voyage costs: fuel, port and canal dues.	17
What are the four shipping markets?	Freight, sale and purchase, newbuilding, demolition.	附录 A8
Where are we in the cycle?	Tankers, especially Suezmax, show peak signals; dry bulk is strong but off its high; MR sits at replacement cost.	14、15
What is derived demand?	Shipping demand comes from trade in cargo, so we start from bauxite, products and crude.	10
Why is supply inelastic now?	Almost every ship is working, and new ships take one to four years, so a shock moves rates, not supply.	12、A10
What decides scrapping?	Age, obsolescence, scrap price, current earnings and expectations.	11
Who bears a carbon cost?	The less elastic side; shipping demand is inelastic in the short run, so in a strong market owners pass most of it on.	21

一个最尖的追问（单独准备）

Q42 10 月一年期 MR 已经 43,000，为什么不马上把 MR #2 也锁掉？（概率：高｜依据：第 8 页 43,000 和第 3 页”一艘留现货”放在一起，正好是老师爱抓的矛盾）

Q: The one-year MR rate is 43,000 in October. Why not lock MR #2 right now?

A (EN): It would be a good outcome, and our base case doesn’ t even count it: we use 27,000. Our rule is one MR fixed for the floor and one open. The one-year rate already prices the expected fall. In Clarksons data since 2014, when MR spot was 25 percent or more above the one-year rate, spot over the next year beat the one-year rate about half the time. So staying open costs little on average and keeps the upside, and if spot stays under 20,000 for eight weeks, we fix it.

要点： 43,000 是评估，交船时按当时成交锁；历史检验约一半时间现货赢；触发线兜底。

五、结合课件与课堂记录的应用题（市场周期等）

老师在 Week 4 课上原话：“what I wanted you to do earlier on was to discuss which market cycle. You will be able to decide in your group presentation for this.”（Week 4 记录约 79%）。Week 3 课件第 96 页的讨论题也是”各船型现在处于周期哪个阶段，用证据说明”。所以**“现在处于周期哪个阶段、你们怎么做”几乎一定会被问**。本节先给一张对照表，再给 17 道应用题。

5.1 课上的周期四阶段（Week 3 课件第 81 至 94 页，Week 3、4 课堂记录）

阶段	运价	新造船市场	二手买卖市场	拆船市场	银行
谷底 Trough	跌到最低效（最老）船的营运成本，老船进入闲置	没人下单，船厂给优惠；有钱的船东这时下单最便宜	被迫甩卖，价格远低于账面价	拆得多，拆船价低	不放贷，收船拍卖
复苏 Recovery	小幅上升，情绪时好时坏	订单开始增加，新造价上升	卖的人少，价格稳定或小涨	拆得少，拆船价上升	开始放贷
高峰 Peak	达到营运成本 2 至 3 倍，实际可以更高；船全速航行	船厂满到两三年后，新造价高	二手价高于重置成本，5 年船卖得比新船贵，老船不验船就买	几乎为零	抢着放贷
崩塌 Collapse	跌得快，跌多少没人知道	订单停滞，价格下跌	成交少，价格下跌	拆船增加	收紧放贷

5.2 用这五个观察点给我们的船型定位（全部用 PPT 上的数字）

观察点	Suezmax（不买）	原油 Aframax（买 1 艘）	MR（买 2 艘）	Kamsarmax（买 2 艘）
运价	现货 718,000/天；一年期 140,250 对三年期 64,375（第 14、16 页）	一年期 89,375 对三年期 37,500（10 月，第 3 页备注、第 8 页）	现货 53,741；一年期从 29,000 升到 43,000（第 16 页）	BDI 2,801，比 9 月中 3,521 低 20%（第 15 页）
新造船市场	订单簿占船队 29.1%（附录 A1）	订单簿 8.4%，最低（第 3 页）	订单簿 18%；Torm 新订 6 艘 MR2（第 15、16 页）	订单簿 13.5%；2027 年交付 171 艘（第 12 页）
二手价对新造价	1.44 倍（10 月），过度交易	1.12 倍	0.99 倍，等于重置成本	1.09 倍，溢价 9%

观察点	Suezmax（不买）	原油 Aframax（买 1 艘）	MR（买 2 艘）	Kamsarmax（买 2 艘）
拆船	各船型几乎停拆（附录 A2、新闻 #229922）	2025 年进 3 艘出 8 艘，船队缩小（第 11 页）	2025 年交付 86 艘、拆 13 艘（附录 A2）	2026 年至今交付 153 艘、拆 6 艘（第 11 页）
判断	**高峰**：五项信号全中	**运价在高峰，但供给最紧、船价不贵**	**复苏后段**：收益强，船价没有过热	**复苏后段，已离开 9 月高点**
我们的做法	不买；高运价由别人去赌	买 1 艘，锁三年 40,000，穿过交付潮	买 2 艘：1 艘锁一年，1 艘现货加 20,000 触发线	买 2 艘：1 艘锁一年 22,000，1 艘现货加 BDI 2,000 触发线

PPT 外补充（只在追问时用）： 按 SIN 2026 年营运成本（MR 7,990、Aframax 8,280、Suezmax 9,800、Panamax 散货 6,150 美元/天）算，Suezmax 现货约是营运成本的 73 倍，MR 现货约 6.7 倍，Kamsarmax 现货约 3.8 倍。PPT 上能直接说的是：船队基准日收入 142,000 是营运成本 36,560 的 3.9 倍。

各阶段对应的做法（课上讲的 vs 我们做的）

阶段	课上讲的	我们做的（PPT 页）
高峰	船东贪心、过度交易；银行抢着放贷；“Who will lock in at $1 million? Nobody… Greedy people.”	不买 1.44 倍的 Suezmax（14）；60% 船天锁定（3、19）；全股权不借钱（4）
复苏后段	运价上升、订单增加、二手价稳定	在重置成本附近买 MR 和 Kamsarmax（5、15）；一半锁一年、一半现货（3）
崩塌（未来可能）	高位交付的新船涌入、现货船在港口排队、降速、运价急跌、拆船增加	三条触发线（23）；Aframax 三年租约穿过 2027 至 2028 交付潮（22）；Eco 船、无债务
谷底（未来可能）	被迫甩卖，有现金的船东抄底	现金加每月约 270 万固定租金，在二手油轮价跌破新造价时买入（21）

5.3 应用题

Q43 现在处于市场周期的哪个阶段？你们对应怎么做？（概率：很高｜依据：Week 3 课件第 81 至 96 页；Week 4 记录约 79%）

Q: Which stage of the shipping cycle are we in, and what are you doing about it?

A (EN): It depends on the segment, so we use the lecture’ s peak checklist, not rates alone, because rates are high almost everywhere. Suezmax ticks every peak box: spot over 700,000 a day, five-year-olds at 1.44 times newbuild, steep backwardation, almost no scrapping. So we don’ t buy it. MR and Kamsarmax are in late recovery: earnings are strong, but prices are at or near replacement cost, 0.99 and 1.09 times. So we buy there, fix one of each for a year and keep one open with a trigger. Crude Aframax has peak rates but the tightest supply, so we buy one and lock it for three years. And we stay all equity, because after a peak comes collapse, when banks foreclose.

要点： 分船型回答；用 5.2 表的五个观察点；最后一句接到”不借钱”。第 14、15、16 页。

Q44 你们怎么知道 Suezmax 已经到顶，而不是还在涨？高峰可能持续好几年。（概率：高｜依据：Week 3 课件第 90 页 “May last a few weeks or several years depending on… geopolitical risks”；Week 3 记录约 85% “Would you ever know when the peak will happen? You never know”）

Q: How do you know Suezmax is at the peak and not still rising? A peak can last for years.

A (EN): We can’t time the top, and we don’t need to. We simply refuse to pay peak prices. Two textbook signals are there: a modern ship selling above newbuild, 1.44 times, and a forward curve where the three-year rate is less than half the one-year rate. If the peak lasts longer, our spot MR and the bull case capture part of it, 23.7 percent. If it ends, we lose nothing on Suezmax.

要点： 不预测顶点；不买就不怕；牛市情景已经包含”高峰延续”。第 14、19 页。

Q45 什么会把油轮市场推进崩塌期？你们盯哪些信号？（概率：高｜依据：Week 3 课件第 93 页崩塌特征；Week 4 记录约 79% “the freight rates might go into a collapse phase next year… delivery of vessels at the top of the market”）

Q: What would push tankers into the collapse stage, and what signals do you watch?

A (EN): Two things: a ceasefire or Hormuz reopening, which removes the supply shock, and the 2027 to 2028 deliveries, the textbook “delivery of vessels at the top of the market”. We watch them every week on slide 23: Hormuz crude tanker transits above 50 a week for four weeks, MR spot below 20,000 for eight weeks, BDI below 2,000 for eight weeks. Each signal has an action written next to it.

要点： 两个崩塌来源；三条触发线；每周五一名组员扫描 SIN。第 12、23 页。

Q46 高峰期银行最愿意放贷，为什么不借钱多买几艘船？（概率：中至高｜依据：Week 3 课件第 92 页 “Banks keen to lend against strong asset values”；Week 3 记录约 92% 谷底期银行收船拍卖；Week 7 课件第 93 页）

Q: Banks love lending at the peak. Why not borrow and buy more ships?

A (EN): Because the stage after a peak is collapse, and in the trough banks foreclose and owners sell at distress prices. Debt means fixed repayments in good years and bad. With all equity, a bad year can’t force us to sell. If the board wants leverage later, the Aframax on its three-year charter is the first ship to mortgage, at 60 to 80 percent of its value.

要点： 第 4 页卡片 “All equity: no debt to service”。

Q47 如果你是现金充裕的船东，现在会下单造新船吗？（概率：中｜依据：Week 3 记录约 95% “If you are a ship owner who has a lot of money, would you order new buildings at this stage?”；Week 4 记录约 79% 高峰期船厂”two to three years, no space”）

Q: If you were an owner with plenty of cash, would you order newbuildings now?

A (EN): Not now. At a peak, yards are full and newbuilding prices are high, and a ship ordered today would deliver into the 2027 to 2028 wave or later. The lecture’s best time to order is the trough, when yards offer incentives and prices are low. That’s what our cash is for: once secondhand tanker prices fall below newbuild, we buy.

要点： 第 5 页”newbuild arrives too late”；第 21 页现金用途。

Q48 为什么有人愿意花 1.44 倍新造价买一艘 5 年的 Suezmax？（概率：中｜依据：Week 3 记录约 81%：2007 年 5 年 Panamax 约 9,000 万、新造约 5,500 万，“If you were to wait for a new ship… maybe the market has already gone down”）

Q: Why would anyone pay 1.44 times newbuild for a five-year-old Suezmax?

A (EN): Because a secondhand ship earns today and a newbuild earns in two or three years, so in a spike buyers pay for prompt delivery. It’s the 2007 story from class: a five-year-old Panamax cost about 90 million against 55 for a new one. That’s the over-trading signal, and the market collapsed in 2008. We don’t want to be the buyer at that price.

要点： 第 14 页；课上 2007 年 Panamax 案例。

Q49 高峰期你们是短租还是长租？（概率：中｜依据：Week 4 记录约 71% “Do you charter in short term or do you charter in long term?”）

Q: At a peak, do you charter short or long?

A (EN): As an owner at a peak, we charter out long where the curve allows, and we don’t charter in at all. The Aframax is fixed for three years at 40,000. The MR and Kamsarmax fixes are one year, which covers our whole window and leaves the 2027 decision open. Chartering in at today’s rates would lock a cost at the top, as slide 5 shows.

要点： 租出长、不租入；第 5、8、22 页。

Q50 拆船几乎为零，符合高峰期的特征吗？对你们意味着什么？（概率：中｜依据：Week 4 记录约 79% “Demolition market low, almost zero, because any sensible owner wouldn’t want to demolish a ship right now”）

Q: Scrapping is almost zero. Is that a peak sign, and what does it mean for you?

A (EN): Yes, it’s a peak sign. In 2026 so far, 153 Kamsarmax and Panamax ships were delivered and only 6 scrapped, and Clarksons says recycling has run below half a percent of the fleet a year for five years. For us it means a pile of old ships waiting. When rates fall, they go to the scrapyard, and that absorbs much of the 2027 wave. That’s our replacement test on slide 13.

要点： 第 11、13、16 页；新闻 #229922。

Q51 谷底期运价会跌到最低效船的营运成本，你们的船撑得住吗？（概率：中｜依据：Week 3 课件第 86 页；Week 3 记录约 92% “the oldest ships will be the least efficient”）

Q: In a trough, rates fall to the operating cost of the least efficient ships. Would your ships survive?

A (EN): Yes. The oldest, least efficient ships hit that floor first and go into lay-up. Ours are Eco and four of five are under ten years old, so they’re the last to stop. Even in our bear case the fleet earns about 128,000 a day, three and a half times its operating cost of 36,560. And three ships are fixed whatever the spot market does.

要点： 熊市 4,470 万 ÷ 350 天约 127,800/天；营运成本 36,560/天（第 19 页、附录 A7）。

Q52 季节性周期你们怎么用？（概率：中｜依据：Week 3 课件第 79 页：北美粮食 9 月底至 10 月集中出运；冬季储油）

Q: How do you use seasonal cycles?

A (EN): Two ways. Kamsarmax #2 trades spot in the fourth quarter because North American grain ships from late September, straight from the seasonal-cycle slide. And winter oil stocking supports products demand in the same quarter, which helps our spot MR. If the season disappoints, the BDI trigger fixes the Kamsarmax for a year.

要点： 第 6、16 页”Kamsarmax: firm in Q4”。

Q53 海运是派生需求，告诉我每艘船背后的货。（概率：中｜依据：Week 3 记录约 82% “Remember, shipping is a derived demand”；Week 2 课件）

Q: Shipping is a derived demand. Show me the cargo behind each ship.

A (EN): MR: products trade grows 6.3 percent in 2027, with longer hauls as refining moves east. Aframax: crude volumes fell 7.3 percent, but the average haul rose 3.3 percent, so tonne-miles held up, and we lock it anyway. Kamsarmax: Guinea bauxite exports are up 29 percent and 2026 is a bumper grain year. Slide 10 starts from the cargo, not the ships.

要点： 第 10 页三个需求引擎。

Q54 课上讲的长期趋势（Form、Place、Process、Time），哪个支持你们的贸易？（概率：中｜依据：Week 5 课件第 39 至 50 页）

Q: Which long-term trends from the lecture support your trades?

A (EN): Process and Place. Process means processing plants changing location: refining capacity moving east lengthens product hauls, which supports our MRs. Place means new sources of supply: Guinea is the key bauxite source and Simandou iron ore has started, which supports dry bulk. Grain sources also shifted after the Russia-Ukraine war, which is why Kamsarmax #2 can move between Black Sea grain, US Gulf grain and coal.

要点： Week 5 课件第 46 页 Place 的例子正好是”俄乌战争后的粮食贸易”；第 6、10 页。

Q55 原油货量下降，运价却涨了好几倍，用课上的供给理论解释。（概率：中｜依据：Week 6 课件第 10、20 页供给缺乏弹性，第 23 页船队生产率）

Q: Crude volumes fell, yet rates multiplied. Explain it with supply theory.

A (EN): When all ships are working, supply is inelastic, so a shock moves the rate, not the fleet. Rerouting around Hormuz and the Red Sea cuts fleet productivity: more days at sea per cargo. Sanctions take about 20 percent of crude tanker capacity out of normal trade. So effective supply shrank faster than cargo. Both causes can reverse quickly, which is why slide 14 calls it a reversible supply shock.

要点： 第 10、14 页；附录 A10 四张图。

Q56 课上的四个市场：你们的钱从哪个市场出、从哪个市场进？（概率：低至中｜依据：Week 3 课件四大市场）

Q: Using the four shipping markets, where does your money go out and come in?

A (EN): It goes out in the sale-and-purchase market: 245 million to other owners for five ships. It comes in through the freight market: time-charter hire on three ships and spot earnings on two. We stay out of the newbuilding market, because cash goes to the yard years before the ship earns. The demolition market is our supply signal: when scrapping restarts, the overhang clears.

要点： 第 4、5、13 页；附录 A8。

Q57 你是油轮船东，会让船进霍尔木兹吗？谁愿意承担这个风险？（概率：低至中｜依据：Week 1 “Imagine if you’re a tanker owner… Would you go or would you not go? Who is willing to take risk?”）

Q: If you were a tanker owner, would you send your ship through Hormuz? Who takes that risk?

A (EN): Our only crude tanker is on a three-year time charter, so the charterer directs it, but standard war-risk terms let an owner refuse a war zone unless the charterer covers the extra insurance. Our spot MR has other options: Indian refineries, the Atlantic and intra-Asia, so it doesn’ t depend on Hormuz. Owners who do go earn the war premium; that’ s the market on slide 14 we choose not to depend on.

要点： 〔PPT 外〕战争险条款属行业惯例（BIMCO 标准条款，Week 1 课件第 65 页讲过 BIMCO），PPT 上没有，只在追问时用。

Q58 课上说谷底才是买船的好时机，你们现在买是不是买贵了？（概率：中｜依据：Week 5 课件第 5 页”航运公司的目标是利用周期低买高卖”；Week 3 记录谷底阶段）

Q: The lecture says the trough is the time to buy. Aren’ t you buying too expensive now?

A (EN): For Suezmax, yes, which is why we don’ t buy it. In our segments we buy at or near replacement cost, 0.99 times for MR and 1.09 for Kamsarmax, so we’ re not paying a peak premium. Waiting for a trough also has a cost: the lecture showed a Capesize trough lasting about ten years, from 1991 to 2001, and meanwhile we’ d earn nothing. Our cash plan keeps the counter-cyclical option open.

要点： 第 5、15、21 页；课上 Capesize 1991 至 2001 年谷底案例。

Q59 课上讲船东贪心、群体心理会让人追高，你们怎么避免自己也这样？（概率：低至中｜依据：Week 5 课件第 25 页 Mass Psychology；Week 3 记录 “Ship owners are greedy people”）

Q: The lecture says owners are greedy and follow the crowd. How do you avoid that yourselves?

A (EN): By writing the rules before the market moves. Sixty percent of ship-days are fixed at today’ s rates, and each spot ship has a numeric trigger that fixes it. We don’ t decide on feelings in the moment.

要点： 第 19、23 页；收尾句”We don’ t forecast the market. We lock the structure.”

六、我们自己先承认的弱点（被问到时这样答）

弱点	被问到时的一句话（EN）	页
MR 订单簿 18%	It’ s our stated risk; we offset it with the price we pay, 2027 demand and one fixed ship.	15、23
现金只有 2%	Deliberate: idle cash earns nothing; fixed hire refills about 2.7 million a month.	23
Kamsarmax #2 是 11 年船	Four of five are under ten; this one is Japan-built, Eco and scrubber-fitted.	4、21
牛市只用一周数据	Twenty percent weight, and only the two spot ships move.	19
权重是主观判断	Equal weights give 20.5 percent, almost the same.	19
MR 买价是评估价	No recent five-year-old MR sale had a published price, so we use the Clarksons assessment.	7
租金对标的是别人的船	They’ re benchmarks; we fix our own ships at last-done levels with charterers of the same standing.	8
一年期租到期在交付潮中间	We decide one quarter ahead with the 2027 deliveries visible: renew, go spot or sell.	22
OPEX 按 350 天扣	Over 365 days it’ s about 14.5 percent after OPEX instead of 14.8.	19、A7

七、三条追问链演练

老师通常连问三四次。下面每条链按顺序练，每一问都用上一问的答案往下接。

链 1 MR 留现货 1. Why keep MR #2 on spot? → 第 3 页：一年期已计入预期回落，留着成本小、保留上行，触发线兜底。 2. But spot is 25% above the one-year rate. Isn’t that a peak signal, like Suezmax? → 是，第 14 页对 Suezmax 也是同样判断；区别在买价：MR 0.99 倍，Suezmax 1.44 倍，所以 MR 回落伤的只是收入，不伤船价。 3. Then why not fix now at 43,000? → Q42。 4. What if spot collapses quickly? → 熊市用 2025 年均值 22,950，低于 20,000 连续 8 周就锁；网格最差 16.8%。

链 2 Aframax 锁三年 1. Why fix the Aframax for three years at 40,000 when the one-year was 53,250 in September? → 第一年少赚约 460 万（1.9 个点），换来三年收入穿过交付潮。 2. In October the one-year is 89,375. You’re leaving over 17 million on the table. → 那是战争溢价，第 14 页的倒挂说明市场认为它是暂时的；三年期评估 37,500，我们对标 40,000 已经不低；一年后一年期船要面对停火和交付潮。 3. And LR2? → LR2 订单是老船的 3.37 倍，能转运原油，是 Aframax 的隐藏竞争者，三年租约就是对冲它。

链 3 现金与执行 1. Why only 5 million cash? → Q2。 2. The MR price is 52 million now. You’re over budget. → Q2 追问：现金降到约 100 万，固定租金几周内补回。 3. What if a ship needs an unplanned repair? → 期租下停租期间租家不付租金，这正是 350 天里预留 15 天停租的原因；没有债务，不会因为一次维修被迫卖船。 4. Who decides when to fix the spot ships? → 第 23 页：每周五一名组员扫描 SIN，触发线到了就执行。

八、全员 30 秒总答（谁被点名都能说）

> We put 245 million into five secondhand ships and keep 5 million in cash: 70 percent tankers, 28 percent dry bulk. Suezmax is at the peak of the cycle, at 1.44 times newbuild with steep backwardation, so we skip it. MR and Kamsarmax are in late recovery, so we buy MR at replacement cost and two Kamsarmaxes at a 9 percent premium, plus the crude Aframax with the lowest orderbook. Three ships are fixed, so the base case is 19.9 percent before operating costs, the bear case 17.9, and even the worst year since 2010 gives about 15. We don’t forecast the market; we lock the structure.

九、全员必背数字卡

类别	数字
分配	2.5 亿 = 船 2.45 亿 + 现金 500 万；油轮 70%、散货 28%、现金 2%
买价	MR 5,000 万 × 2（10 月评估 5,200 万）；Aframax 7,500 万；Kamsarmax 3,800 万 + 3,200 万
租金	MR #1 30,000；MR #2 基准 27,000；Aframax 40,000 三年；Kamsarmax #1 22,000；Kamsarmax #2 基准 23,000；船队每天 142,000
收益	基准 4,970 万（19.9%）；熊市 4,470 万（17.9%）；牛市 5,920 万（23.7%）；期望 5,010 万（20.0%）；扣 OPEX 后 3,690 万（14.8%）
结构	锁定 60% 船天、65% 基准收入（3,220 万）；压力测试 15.2%（扣 OPEX 后 10.1%）；网格最差 16.8%；两艘现货合计低于每天 15,100 才跌破 15%
成本	OPEX 每天 36,560，350 天 1,280 万（365 天约 1,334 万）；佣金 3.75% 时基准 19.1%

类别	数字
见顶信号	Suezmax 5 年船 1.44 倍新造（10 月，9 月 1.23 倍），1.3 亿对 9,000 万；一年期 140,250 对三年期 64,375；现货 718,165
买在价值	MR 0.99 倍（10 月，9 月 0.96 倍）；Kamsarmax 1.09 倍（溢价 9%）；Aframax 1.12 至 1.13 倍
供给	原油 Aframax 订单簿 8.4%（62 艘对 223 艘老船）；Kamsarmax 13.5%，2027 年交付 171 艘、2028 年 141 艘；MR 18%（按艘 15.6%），每年约 106 艘；LR2 3.37 倍
需求	几内亚铝土矿 +29%（1 至 4 月）；成品油 2027 年 +6.3%、吨海里 +6.5%；原油 2026 年货量 −7.3%、平均运距 +3.3%
市场	BDI 2,801（10 月 13 日），比 9 月 3,521 低 20%；MR 现货 53,741；MR 一年期 10 月 43,000；煤炭航次 TCE 约 27,400
触发线	MR 现货连续 8 周低于 20,000；BDI 连续 8 周低于 2,000；霍尔木兹原油轮每周超过 50 艘连续 4 周
事件	美中港口费暂停 2026 年 11 月 10 日前后到期
数据	60 个时间序列、40 笔成交、55 条新闻；正文定价 16 笔成交加 1 个评估
融资	全股权；银行可贷 60% 至 80%
周期判断	Suezmax 高峰（不买）；原油 Aframax 运价高峰但供给最紧（买 1 锁 3 年）；MR 复苏后段（买 2，锁 1）；Kamsarmax 复苏后段、已离开 9 月高点（买 2，锁 1）
